FORGED MEDIA DETECTION · TRUST & SAFETY

Decision record

Evidentiary Analysis Report · confidential

REMOVED AUTOMATICALLY

(AUTO-FLAGGED)

This document records what happened when an image was checked by Forged Media Detection. Outcome: the content was removed automatically (AUTO-FLAGGED). Routing was automatic (no separate moderator override). Prepared by Admin. No formal takedown complaint was attached to this analysis. The original media is not stored with this report—only fingerprints (hashes), scores, decisions and timestamps.

Page 1 of this file is a cover for people. Technical detail starts on the next page.

What this report is

This is a signed decision record for analysis #169. It explains the outcome in plain language, shows the model scores and forensic panels that informed it, then lists the technical identifiers lawyers and investigators need.

How to verify this report

Anyone can check that the facts in this report still match the signed record. Open GET /api/verify-report/RPT-169-20261019150832 (or the Verify page in the console). Results are VALID, TAMPERED (with changed fields named), or NOT_FOUND. Public keys, including retired ones, are at /api/verify-report/keys. You do not need a moderator account.

Report ID **RPT-169-20261019150832**

Important limits (read this)

Model scores are automated estimates that support human judgement—they are not a court finding of who created a deepfake or whether a crime occurred. Forensic panels (Grad-CAM, FFT, ELA) help explain where the forgery model looked and what compression patterns appear; they do not prove manipulation on their own. This report is process evidence: what the system recorded, decided and when.

01 **Scores** — How strong each check was

02 **Forensics** — Where the model looked

03 **Record** — IDs, trail, signature

01 · Model scores

Two independent checks, scored from 0 to 1. Higher means more concerning for that check. Crossing the review line sends the item to a person; crossing the auto-remove line withholds it.

Signs of AI editing

0.75

0.7496 · Review band

Review line 0.05 · Auto-remove 0.85

Explicit content (separate model)

1.00

1.0000 · Auto-flag band

Review line 0.50 · Auto-remove 0.85

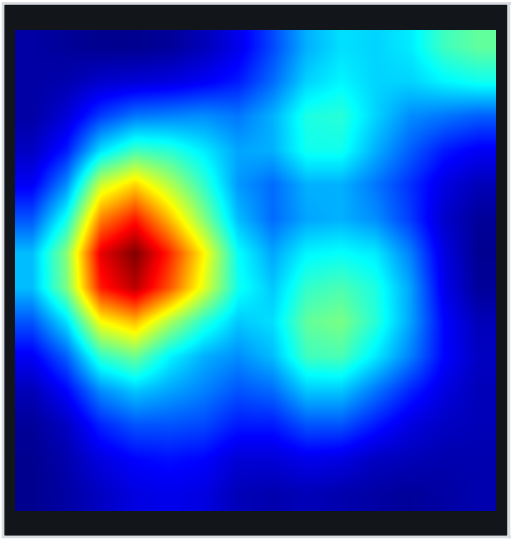

Likely generation style

Diffusion model (e.g. inpainting / img2img) (confidence 0.76). Best-effort attribution, not a verdict.

Thresholds are those configured when this report was generated. Scores support human judgement; they are not probabilities of guilt.

02 · Forensic panels

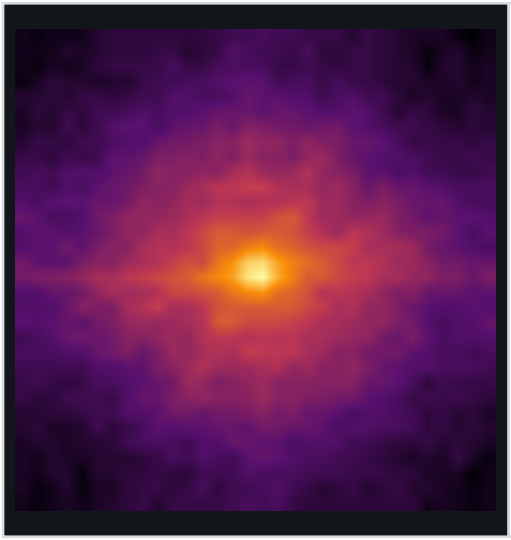

Each panel below is a full-width card: the image on the left, a plain-language caption on the right. Together with the scores, they explain the decision. They do not by themselves prove that media was forged.

Grad-CAM attention

`Peak at x 21%, y 50%`

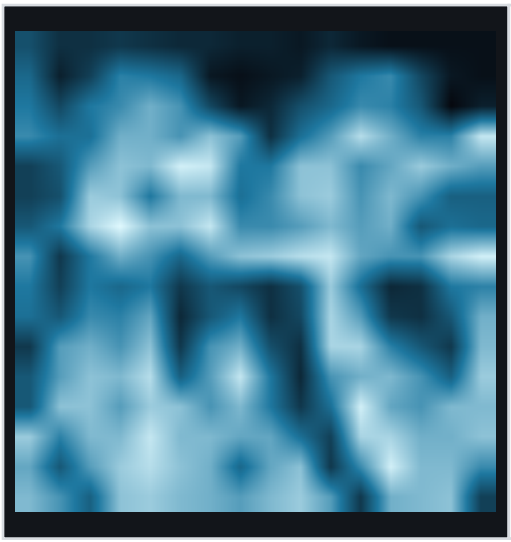

In plain terms: warmer colours show where the editing-detection model paid most attention. Red = strongest influence on the forgery score—not proof of a fake face on its own.

FFT magnitude spectrum

`High-frequency energy 1.91%`

In plain terms: a view of fine detail energy. Grid or star-like patterns can hint at resizing or generator artefacts. A quiet spectrum does not mean the image is genuine.

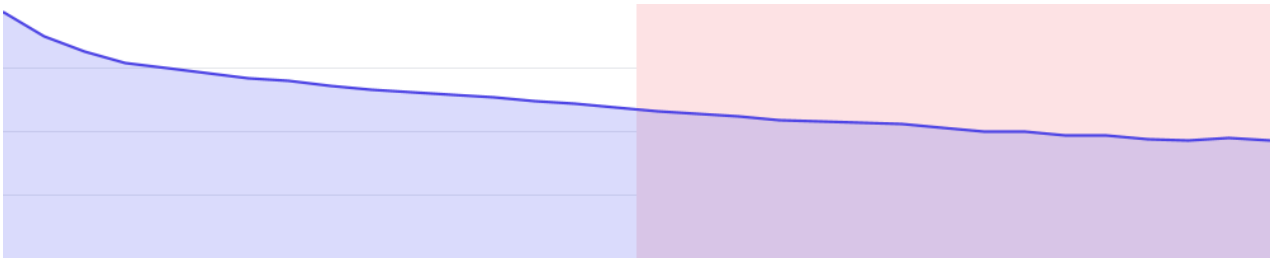

Error level analysis

`Mean 2.91 | p95 7.67 | max 23 (q90)`

In plain terms: bright patches recompress differently from the rest and may have been edited or pasted. Uneven lighting or heavy compression can also light up.

Radial spectrum profile

Low to high frequency (shaded half = high frequency). Complements the FFT panel.

Panel source: signature

Panels are drawn from the coarse forensic signature captured at analysis time (14x14 attention, 16x16 error-level and 32x32 spectrum grids). No media was retained.

03 · Legal deadline (if a complaint was filed)

Complaint	None filed. This item is not subject to a takedown SLA.
Jurisdiction	IN
SLA timestamps	Not applicable

04 · Moderation, appeals and what happens next

Model decision	AUTO_FLAG
Decided by	Automated routing only (no moderator decision)
Assignment	Unassigned
Senior escalation	Not escalated
Second review	None pending
Uploader notice	`UPL-GWFJ-GM4A`
Appeal	None filed

Changes away from AUTO-FLAGGED need a second moderator; appeals are decided, and their outcome second-reviewed, by someone other than the people who made or upheld the contested decision. The public audit trail below records these steps without naming moderators.

05 · Technical identifiers

Analysis ID	#169
Provenance ID	`3aafae3f-b9f8-4163-aa4c-caa1282620ce`
Media type	Image
Analysed at	2026-10-19 14:51:20 UTC (20:21:20 IST)
Re-upload of	`1aae599e-6dcf-4095-93ec-98edc290569c`
Pixel hash (SHA-256)	`sha256:e97ee99a75e5540adaa929fb2f56f52609d8e41ffdd1fd90f18e5e7e345cccea`

Perceptual hash (pHash)	84782d98d7a65793

06 · Content credentials (C2PA)

Manifest	None. The upload carried no C2PA Content Credentials.

Absence of credentials is not evidence of manipulation; most capture devices and platforms do not yet write or preserve them.

07 · Audit trail (public timeline)

Append-only events tied to the provenance ID. Actor names here are roles or system labels, not a full personnel file.

Time (UTC)	Event	Actor	Detail
2026-10-19 14:51:20	**ANALYZED**	system	Scored forgery 0.75, explicit 1.00; routed to AUTO_FLAG
2026-10-19 15:08:23	**REPORT GENERATED**	moderator	Evidentiary report RPT-169-20261019150823 generated and signed (Ed25519 key ee13b8b8b6c76035); PDF SHA-256 c5e06c8c35c58cc85d276f695b8aed47cf3d3e74071cfe2b1fa662e6ee137c79

08 · Integrity and data handling

- Media retention: the analysed media is not stored. The system keeps only hashes, scores, decisions, SLA metadata and the coarse forensic signature used for the panels above.

- Provenance: labelled copies of this media carry a signed manifest with provenance ID 3aafae3f-b9f8-4163-aa4c-caa1282620ce. Anyone can check it and the audit trail at /verify/3aafae3f-b9f8-4163-aa4c-caa1282620ce.

- Chain of custody: the SHA-256 of this PDF is recorded in the item's audit trail as event REPORT GENERATED for RPT-169-20261019150832. Recompute the file's SHA-256 and compare it to confirm the file bytes are unaltered.

- Datasets: models were trained and evaluated only on consenting-actor research benchmarks (FaceForensics++, DFDC, Celeb-DF).

09 · Glossary

pHash	A short perceptual fingerprint of the picture. Similar images share nearby codes; it is not the image itself.
Pixel hash (SHA-256)	A fingerprint of the exact file bytes. Any change to the file changes this code.
Provenance ID	A public ID for this analysis's timeline. You can look it up without signing in.
SLA	Service level agreement — here, the legal deadline to handle a takedown complaint.
C2PA	Content Credentials: optional signed claims embedded by a camera or tool about how media was made.
Ed25519	The digital signature algorithm used so others can check this report without a secret password.
AUTO-FLAGGED	System code for "removed automatically" when a score crosses the auto-remove line.

10 · Digital signature

This signature covers a fixed list of facts (the canonical snapshot), not the decorative layout of the PDF. If those facts change later, verification returns TAMPERED.

Algorithm	Ed25519 over the SHA-256 of the signed fields
Signed at	2026-10-19 15:08:32 UTC (20:38:32 IST)
Signing key ID	`ee13b8b8b6c76035  (file key provider)`
Signed content SHA-256	`449d877647335cdec973eb9712b41436df3fdd646980097d934a215c373eba00`
Signature (base64)	`YZDOrC0hsqgLw7FB8PCGbEwiRTHA3wFCLaVVYrzbmd2NtfNvMJQhLkCxxycvHUXDhKtj6WWtl7Z4xAHsXj0wBg==`
RFC 3161 timestamp	Not requested (no timestamp authority configured); the signing time is this server's clock.
Verify	`GET /api/verify-report/RPT-169-20261019150832  (VALID / TAMPERED / NOT_FOUND)`

Signed fields: report ID and time, analysis and provenance IDs, decision, both scores, generation family, hashes, jurisdiction, complaint and SLA timestamps, and (when present) media type, frames sampled, deciding moderator, appeal outcome and C2PA status. Keys rotate; retired public keys stay published at /api/verify-report/keys so older reports still verify. Scope: this deployment uses a development key stored by the server. For stronger custody use a KMS (Vault Transit) and a trusted RFC 3161 timestamp authority.
